#### Determine **fundamental limitations** in control

Here: Describe the "information" needed to make a subset invariant for a control system

Classically, entropy is used in dynamical systems theory in order to describe the information generated by the systems and to classify them.

A recent survey on various definitions and application areas of **entropy** is Amigó et al. DCDS B (2015).

Control systems:

**Delchamps** (1990) (ergodic theory for quantized feedback)

Topological versions have been analyzed, in particular, by

Nair, Evans, Mareels and Moran (2004) Kawan, Springer LNM Vol. 2089 (2013)

<ロト < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

# Control systems

We consider control system in discrete time given by

$$x_{n+1} = f(x_n, u_n), n \in \mathbb{N} = \{0, 1, ...\},\$$

where  $f: M \times \Omega \to M$  is continuous and M and  $\Omega$  are metric spaces. The solution with  $x_0 = x$  and  $u = (u_n) \in \mathcal{U} := \Omega^N$  is denoted by  $\varphi(n, x, u), n \in \mathbb{N}$ .

We assume that for every  $x \in Q \subset M$  there is  $u(x) \in \Omega$  with  $f(x, u(x)) \in Q$ .

What is the "information" necessary to keep the system in Q?

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ − ∽ Q (~

We consider control system in discrete time given by

$$x_{n+1} = f(x_n, u_n), n \in \mathbb{N} = \{0, 1, ...\},\$$

where  $f: M \times \Omega \to M$  is continuous and M and  $\Omega$  are metric spaces. The solution with  $x_0 = x$  and  $u = (u_n) \in \mathcal{U} := \Omega^N$  is denoted by  $\varphi(n, x, u), n \in \mathbb{N}$ .

We assume that for every  $x \in Q \subset M$  there is  $u(x) \in \Omega$  with  $f(x, u(x)) \in Q$ . What is the "information" respective to been the system in Q.

What is the "information" necessary to keep the system in Q?

**Motivation:** Suppose that the present state  $x_n$  of the system is measured. If the controller has complete information about the present state, it can adjust a feedback control u(x) appropriately. However, if the measurement is sent to the controller via a (noiseless) digital channel with bounded data rate it is of interest to determine the minimal data rate needed to make Qinvariant. More abstractly: What is the minimal average information needed to make Q invariant? This talk consists of three parts:

- Some motivation from classical entropy of dynamical systems
- Topological invariance entropy for control systems
- coder-controllers and minimal bit rates
- Relations to controllability properties

Consider the **logistic map** on the interval X = [0, 1] given by

$$F_4(x) = 4x(1-x), x \in [0, 1].$$

The topological entropy of  $F_4$  is

$$h_{top}(F_4) = \log_2 2 = 1 > 0.$$

Hence this is a **chaotic map**.

# The logistic map again

Recall

$$F_4(x) = 4x(1-x)$$
 on  $[0,1]$ .

A (trivial) invariant measure is  $\mu = \delta_0$  with entropy  $h_{\delta_0}(F_4) = 0$ . A nontrivial invariant measure is given by its density (with respect to Lebesgue measure)

$$\frac{1}{\pi\sqrt{x(1-x)}}, x \in [0,1].$$

The corresponding metric entropy is

$$h_\mu(F_4) = \log_2 2 = 1$$

(hence equal to the topological entropy).

イロト イポト イヨト イヨト

#### The Variational Principle states that

$$\sup_{\mu} h_{\mu}(T) = h_{top}(T)$$

and invariant measures  $\mu$  with maximal entropy, i.e.,  $h_{\mu}(T) = h_{top}(T)$ , are of special relevance.

For smoth maps, the entropy can often be characterized by the positive **Lyapunov exponents**.

イロト イポト イヨト イヨト

Describe the minimal information to make a compact  $Q \subset M$  invariant for

$$x_{n+1}=f(x_n,u_n), u_n\in\Omega,$$

with solutions  $\varphi(n, x_0, u)$ ,  $n \in \mathbb{N}$ , in M.

Here this will be done in a topological framework.

Topological invariance entropy is based on **itineraries in Q** corresponding to **invariant open covers** of Q. They are constructed by feedbacks keeping the system in Q and replace the open covers.

**Observe:** This is not directly related to the entropy of the uncontrolled system which may behave very wildly in Q, while Q itself may be invariant. Hence the entropy of the dynamical system may be positive while the invariance problem is trivial.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○○

## Example

 $f_{\alpha}(x,\omega) = x + \sigma \cos(2\pi x) + A\omega + \alpha \mod 1, \ \omega \in \Omega = [-1,1].$ With  $A = 0.05, \sigma = 0.1, \alpha = 0.08$  consider the set Q = [0.2, 0.5].

Topological invariance entropy for control systems

An invariant open cover C = (, B, F) is given by  $\tau \in \mathbb{N}$ , an open cover  $\mathcal{B}$  of Q and  $F : \mathcal{B} \to \Omega^{\tau}$  with

 $\varphi(j, B, F(B)) \subset \operatorname{int} Q$  for  $j = 1, \ldots, \tau$  and  $B \in \mathcal{B}$ .

<ロト < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

## Topological invariance entropy for control systems

An **invariant open cover**  $C = (\tau, \mathcal{B}, F)$  is given by  $\tau \in \mathbb{N}$ , an open cover  $\mathcal{B}$  of Q and  $F : \mathcal{B} \to \Omega^{\tau}$  with

$$\varphi(j, B, F(B)) \subset \operatorname{int} Q$$
 for  $j = 1, \dots, \tau$  and  $B \in \mathcal{B}$ .

For a *C*-itinerary  $\alpha = (B_0, ..., B_{n-1}) \in \mathcal{B}^n$  define  $u_{\alpha} = (F(B_0), F(B_1), ...)$  and

 $B_n(\alpha) = \{ x \in Q \mid \varphi(i\tau, x, u_\alpha) \in B_i \text{ for } i = 0, \dots, n-1 \}.$ 

These sets again form an open cover of Q,

$$\mathfrak{B}^{(n)} = \{ B_n(\alpha) \mid \alpha \in \mathcal{B}^n \}.$$

## The control problem

#### Explanation

**System** Deterministic, discrete or continuous time **Coder** Encodes the state by a symbol from a (time-dependent) alphabet at discrete times  $k\tau$ , k = 0, 1, 2, ...**Controller** Generates open-loop controls on a finite time interval  $[0, \tau]$ 

#### Relation to coder-controllers and data rates

A coder-controller has the form  $\mathcal{H}=(\mathit{S},\gamma,\delta,\tau)$  where

-  $S = (S_k)_{k \in \mathbb{N}}$  denotes finite coding alphabets

- the coder mapping  $\gamma_k:M^{k+1}\to S_k$  associates to the present and past states the symbol  $s_k\in S_k$ 

- at time  $k\tau$  the controller mapping is  $\delta_k : S_0 \times \cdots \times S_k \to \Omega^{\tau}$ .

The transmission data rate is

$$R(\mathcal{H}) = \liminf_{k o \infty} rac{1}{k au} \sum_{j=0}^{k-1} \log \#S_j.$$

◆ロシ ◇掃 ▶ ◆ ヨ ▷ ◆ ヨ ▶ ○ ヨ ○ ◇ ◇ ◇

#### Relation to coder-controllers and data rates

A coder-controller has the form  $\mathcal{H}=(\mathit{S},\gamma,\delta,\tau)$  where

-  $S = (S_k)_{k \in \mathbb{N}}$  denotes finite coding alphabets

- the coder mapping  $\gamma_k:M^{k+1}\to S_k$  associates to the present and past states the symbol  $s_k\in S_k$ 

- at time  $k\tau$  the controller mapping is  $\delta_k : S_0 \times \cdots \times S_k \to \Omega^{\tau}$ . The transmission data rate is

$$R(\mathcal{H}) = \liminf_{k \to \infty} \frac{1}{k\tau} \sum_{j=0}^{k-1} \log \#S_j.$$

 ${\mathcal H}$  renders Q invariant if for every  $x_0 \in Q$  the sequence

$$x_{k+1} := \varphi(\tau, x_k, u_k), k \in \mathbb{N},$$

with

$$u_k = \delta_k(\gamma_0(x_0), \gamma_1(x_0, x_1), \dots, \gamma_k(x_0, x_1, \dots, x_k)) \in \Omega^{\tau}$$

satisfies

 $\varphi(i, x_k, u_k) \in Q$  for all  $i \in \{1, \dots, \tau\}$  and all  $k \in \mathbb{N}$ .

Fritz Colonius (Universität Augsburg)

January 21, 2019 21 / 35

**Theorem.** For a compact and controlled invariant set Q it holds that

$$h_{inv}(Q) = \inf R(\mathcal{H}),$$

where the infimum is taken over all coder-controllers  $\mathcal H$  that render Q invariant.

#### Invariance pressure

Introduce a potential  $f \in C(\Omega, \mathbb{R})$  for the control values. Let  $K \subset Q$  be compact s.t.  $\forall x \in K \exists u \in \mathcal{U} : \varphi(\mathbb{R}_+, x, u) \subset Q$ . A set  $S \subset \mathcal{U}$  is a  $(\tau, K, Q)$ -spanning set if

$$\forall x \in K \exists u \in S : \varphi([0, \tau], x, , u) \subset Q.$$

With  $(S_{\tau}f)(u) := \int_0^{\tau} f(u(t)) dt$  let

$$a_{\tau}(f, K, Q) := \inf\{\sum_{u \in \mathcal{S}} e^{(S_{\tau}f)(u)}; \ \mathcal{S} \text{ is } (\tau, K, Q) \text{-spanning}\}.$$

The invariance pressure is

$$P_{inv}(f, K, Q) = \limsup_{\tau \to \infty} \frac{1}{\tau} \log a_{\tau}(f, K, Q).$$

If  $f \equiv 0$ ,  $\sum_{u \in S} e^{(S_{\tau}f)(u)} = \#S$ . Then this reduces to a known characterization of the invariance entropy.

Fritz Colonius (Universität Augsburg)

Invariance Entropy

January 21, 2019 26 / 35

Consider a linear control systems in  $\mathbb{R}^d$ 

$$\dot{x} = Ax + Bu$$
,  $u(t) \in \Omega \subset \mathbb{R}^m$ ,

with a compact neighborhood  $\Omega$  of 0 and assume (A,B) controllable, A hyperbolic.

For  $K \subset D$ , the unique control set with  $intD \neq \emptyset$ , one has:

$$P_{inv}(f, K, D) \leq \sum_{\lambda \in \sigma(A)} \max(0, \operatorname{Re} \lambda) + \inf_{T, u(\cdot)} \frac{1}{T} \int_0^T f(u(s)) ds,$$

where the infimum is taken over all T > 0 and all T-periodic controls  $u(\cdot)$  with values in a compact subset of  $int\Omega$  and a T-periodic  $x(\cdot) \subset intD$ .

For **dynamical systems** it is well known that the entropy is already determined on the recurrent set.

What about invariance entropy?

For **control systems** recurrence properties are replaced by controllability properties.

Here subsets of complete approximate controllability (in Q) are of relevance, called **control sets**.

#### W-control sets

For a **open** subset W of the state space let  $\varphi_W(n, x, u)$  be the trajectories within W and define the **reachable and controllable set within W** by

$$\begin{aligned} \mathcal{R}_W(x) &= \{ \varphi_W(n, x, u) \text{ for some } n \in \mathbb{N} \text{ and } u \in \mathcal{U} \} \\ \mathcal{C}_W(x) &= \{ y \in W \, | \varphi_W(n, y, u) = x \text{ for some } n \in \mathbb{N} \text{ and } u \in \mathcal{U} \}. \end{aligned}$$

## W-control sets

For a **open** subset W of the state space let  $\varphi_W(n, x, u)$  be the trajectories within W and define the **reachable and controllable set within W** by

$$\begin{aligned} \mathcal{R}_W(x) &= \{ \varphi_W(n, x, u) \text{ for some } n \in \mathbb{N} \text{ and } u \in \mathcal{U} \} \\ \mathcal{C}_W(x) &= \{ y \in W \, | \varphi_W(n, y, u) = x \text{ for some } n \in \mathbb{N} \text{ and } u \in \mathcal{U} \}. \end{aligned}$$

**Definition.** A set *D* is called an **invariant W-control set** if (i)

$$\overline{D}^W = \overline{\mathcal{R}_W(x)}^W$$
 for all  $x \in D$ ,

where the closure is taken with respect to W and (ii) there is  $x \in D$  with  $x \in intC_W(x)$ .

**Remark.** Condition (ii) is crucial for discrete-time systems.

# Existence of invariant W-control sets

#### Theorem. Assume

- the state space M is a connected analytic Riemannian manifold
- $W \subset M$  is connected open and relatively compact
- the control range  $\Omega \subset \overline{\mathrm{int}\Omega} \subset \mathbb{R}^m$  and  $f: M imes \Omega o M$  is analytic

-  $\Omega_{sub} := \{ \omega \in \Omega | f(\cdot, \omega) \text{ is submersive} \}$  is the complement of a proper analytic subset.

Then the following are equivalent:

(i) There are at least one and at most finitely many **invariant W-control** sets D and for every  $x \in W$  there is D with

$$\mathcal{R}_W(x) \cap D \neq \emptyset.$$

(ii) There is a compact set  $F \subset W$  with

$$F \cap \overline{\mathcal{R}_W(x)} \neq \emptyset$$
 for all  $x \in W$ .

Albertini and Sontag (1993), Wirth (1998), Patrão and San Martin (2007)

Fritz Colonius (Universität Augsburg)

**Theorem.** Under the assumptions of (i) in the previous theorem let  $Q := \overline{W} \subset M$  and consider a compact  $K \subset Q$ . Assume

(i) for every relatively invariant *W*-control set  $C_i$  there is a compact  $K_i \subset K \cap C_i$  with  $intK_i \neq \emptyset$ .

(i) for the finitely many invariant W-control sets  $D_i$ 

$$f(\bigcup_i \overline{D_i}, \Omega) \cap (\partial Q \setminus \bigcup_i \overline{D_i}) = \emptyset.$$

Then

$$h_{inv}(K, Q) = \max_{i} h_{inv}(K_i, C_i).$$

where the maximum is taken over all relatively invariant W-control sets  $C_i$ . **Remark.** In the continuous-time case a similar result has been shown in

FC/Lettau (2016).

$$f_{lpha}(x,\omega) = x + \sigma \cos(4\pi x) + A\omega + lpha \mod 1.$$

Two W-control sets  $D_1$  and  $D_2$  (to the right) in W = (0.1, 0.7). The invariance entropies on Q = [0.1, 0.7] and on  $\overline{D_2}$  coincide.

Sar

Classical entropy of dynamical systems describes the **total information** generated by the system topologically or with respect to an **invariant measure**.

In contrast, entropy for control systems describes the **minimal information** for invariance in a topological context.

The data rate theorem relates the topological invariance entropy to the minimal bit rate needed for invariance.

In a similar vein, minimal bit rates for other control problems, e.g. stabilization or state estimation, can be determined.

There are also several efforts to develop a measure-theoretic notion of invariance entropy.
